In order to convert your old or existing firegrate into a decorative gas coal fire the following conditions are required:

- You must have an existing fireplace and working flue/chimney that are suitable for burning a wood fire. We recommend that you have the flue/chimney swept before installation. For safety & aesthetic reasons your fire must be vented properly. These burners are made for use with natural gas only, and have an input of 41,000 BTU p/hr.
- Despite the fact that custom fitted trays are made exactly the same way as the Homefires Listed burners, because they come in custom dimensions, they are not listed with a U.S. testing agency. This means that they may not meet code in your area, will not pass inspection in new construction, and may make it difficult to find someone to install them. It is impossible to customize your existing grate and still comply with mechanical codes.
- Homefires accepts no responsibility or liability for incidental or consequential damages.
- These units can be installed by any certified plumber or mechanical contractor. All the necessary embers, fittings and installation instructions are supplied, and they can be used with either a floor valve or a manual gas cock.

To insure that the custom tray will fit and indeed suit your existing grate the following information is required:

- Mail or fax a template, or trace of the interior of your existing grate. The burner will be made to the exact size of the template or smaller so please be accurate.
- The burners will be made with an adjustable elbow that will allow for connection from any side. This elbow is about 1" wide and is in the center front of the tray. If you have a grid or a part of the grate that blocks or restricts this elbow it will have to be removed or cut out.
- Please send a polaroid or picture of the grate for visual reference.
- Please sketch the general shape of the tray to be made in the box below. Be sure to identify which side is front and which is back.
